87 Transgenic non-human mammalian HiA-Bw 52 gene - useful for mouse model of human disease
85 Transgenic non-human disease
85 Disclosure; Fig 1: 8pp; Japanese.
86 The sequence shows the exon 2 alpha-1-domain of the human leukocyte
87 The sequence shows the exon 2 alpha-1-domain of the human leukocyte
88 The sequence shows the exon 2 alpha-1-domain of the human leukocyte
88 The sequence in Port of mouse, or their ancestors at the primary developmental biological step via transplantation into the zygote or developmental transgenic non-human mammals incorporating the HiA-Bw 52 gene in both their germ cells and somatic cells. Transgenic non-human mammals conty, HiA-Bw 52 are useful for the analysis of expression of the gene, His structure, and prodn. of mouse models of human disease.

Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridomas derived from transgenic animals carrying HLA gene and I mimulised with HLA antigen of different allotype Disclosure; Fig 1 A-G; 20pp; English.

C The human HLA-B51 gene was injected into fertilised mouse eggs and then these introduced into the uterus of a pseudo pregnant mouse. The young were tested to ensure incorporation of the gene into the chromosome, and one of them mated 3 times with a normal male to produce 16 young, seven of which carried the HLA-B51 gene. The transgeneic offspring were immunised with HLA-B51 gene. The spleen lymphocytes were fused with myeloma cells. Hybridomas producing antibodies were selected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seq_documentation_block:

New DAM for class 1 human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc.
Claim 2: ppl1-12; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells.

38 A hybridisation probe for detecting the HLA B27 gene, e.g. for assessing susceptibility to rheumatic disorders such as ankylosis spondylitis, or may be used to transform cells corp produce mono- or polyclonal HLA B27 antiboddes for use in immunoassay.
39 C Gequence 1026 BP; 213 A; 307 C; 344 G; 162 T;
Claim 1; Page 1; 11pp; Japanese.

Probes comprising part of the sequence can be used to identify class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HLA-BW53 antigen. See also J03112485 and J03112486.

Hybridomas producing antibodies were selected. Sequence 1089 BP; 223 A; 336 C; 359 G; 171 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HLA-Bw53 exon. Haman leukocyte antigen; probe; major histocompatibility complex; MHC; class I; ss. Homo saplens.
                                                                                                                                                                                                                                                                                                                                                                                Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridomas derived from transgenic animals carrying HLA gene and immunised with HLA antigen of different allotype Disclosure; Fig 1 A-G; 20pp; English.

The human HLA-BW52 gene was introduced into mouse L cells and then these cells used to immunise one of the transgenic mice (see 005693).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     P-PSDB; R12463.
HLA-Bw53 gene, DNA probe and transformant cells - used for
immunisation, identifying specificity of antiserum etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      44.00 Length: 10

 DNA coding for human histocompatibility antigen HLA-B 27 - useful for diagnosis and antigen and antibody prodn.

Claim 1: p6: 13pp: German.

THE DNA may be used to detect the HLA-B 27 gene (opt. mutated) in human genetic material. The HLA-B 27 may be used to detect anti-HLA-B 27 antibodies in human serum. The antibodies may be used to determine HLA-B 27 levels in human serum, e.g. for diagnosis of rheumatic disorders, esp. ankylosing spondylitis.

Detecting pre-disposition to seronegative spondylarthropathies - Trom the absence of a C residue at a specific position in the 3'-flanking region of the HLA B77 allele

Claim 1; Page 52-56; 68pp; Bnglish.

Genetic predisposition to seronegative spondyloarthropathies (SNSA) is detected by determining the absence of a cytosine nuclectide in the 3' flanking region (see also T61647-48) of an HLA-B gene at a position corresponding to nuclectide 4495 of the HLA-B27 consensus sequence given in T61639. Probes and primers (see also T61640-46) chased on this region can be used in diagnostic assays to detect the genetic predisposition to SNSA, and permit the distinction of B27+ individuals who are resistant to SNSA from B27+ normal individuals who are resistant to SNSA from B27+ normal individuals sequence 6553 Bp; 1443 %; 1619 C; 2017 G; 1474 T;

 Example 1: Page 27; 65pp; English.

PCR primer 5 (T12618) was designed to introduce a BamHI site print of cDNA coding for the VL region of anti-mouse CD3-epsilon chain scFv 2C11. It was used with antisense primer 6 (T12619), which introduces a (G4S)3 linker and NotI site, for the PCR amplification of 2C11 VL DNA. VH CDNA was amplified using primers 7 and 8 (T12620-21). The PCR products were subcloned into pcDNA/AMP and expressed in GOS-7 transfectants. Blologically sective ScFv 2C11 was secreted into the cell culture medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single-chain Fv molecules with additional glycosylation sites increased rates of secretion, decreased antigenicity, modified ligand binding affinity and are protected from proteolytic
                                                                                                                                                                                                                                                                                                                                                                                                                  20-JUL-1996 (first entry)
2C11 SCFV VL PCR primer 6.

Q71567 is the DNA sequence which encodes carcinoembryonic antigen (CEA) R60619. CEA is free from cross-reactive CEA-like antigens, it is antigenically indistinguishable from the solution form of CEA shed from tumour cells, and it is devoid of ethanolamine. R66619 can be used in a reagent composition for detecting neoplastic diseases in biological samples, or in an immunoassay process where it can specifically detect the presence of tumour cells in a biological sample e.g. blood. Timmunogenic carcinoembryonic antigen produced using insect cell
bacilovirus expression system - useful in cancer therapy
bacilovirus expression system - useful in cancer therapy
bisclosure; Page 47-49; Edpp; English.

A portion (136494) of pA9080 ACNPV-CEA vector codes for recombinant,
soluble, immunogenic carcinoembryonic antigen (rCEA) (R98519). The
chuman CEA gene was cloned from colon adenocarcinoma LSI14T (ATCC
CL 188) cells by PCR (see also T36493-94) and modified for
cxpression in insect cells by replacement of the signal sequence
with a 61 kDa baculovirus signal sequence, and deletion of DNA
encoding the hydrophobic C-terminal region. The construct was
concoding the hydrophobic C-terminal region. The construct was
inserted into baculovirus vector pW6S12 contg. a polyhedrin promoter,
giving plasmid pA9080 AcNPV-CEA. rCEA was produced at high levels
con in SF90+ insect cells grown in serum-free media and isolated to a
purity of over 95%. It can be used as an immunogen in humans to
protect against breast, lung or colon cancer.

Example 14; Page 34; 80pp; English.

Example 14; Page 34; 80pp; English.

Example 183085, R8309-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75.84 of the alpha-1 domain of the class I MHC HLA-B2702.

These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly of the patient.

r-cell modulator: autoimmune disease; tissue destruction; alphal-domain; mandlator: autoimmune disease; tissue destruction; antigen; perforin; insulin-dependent diabetes mellitus; multiple sclerosis; inflammation; insulin-dependent diabetes mellitus; multiple sclerosis; inflammation; thenmatoid arthritis; psoriasis; pemphigus vulgaris; sjogren's disease; thyroid disease; Hashimoto's thyroiditis; myasthenia gravis; granzyme; autologous target cell; cytokine release; T cell activation; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cell mediated attack on target cells

Tage 20, 24pp; English.

W07512-W07518 represent T-cell modulating peptides that can be used in the method of the invention. These sequences are based on a portion of the generic peptide corresponding to residues 70-91 of the alphal-domain of the major histocompatability complex (MHC) class I antigen (see W07510). The method is for affecting the course of an autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treatment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of clinical symptoms of insulin dependent diabetes by modulating T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                               Compsns. comprising lymphoid surface membrane proteins - which may

ö
involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are multiple sclerosis, rheumatoid arthritis, psoriasis, pemphigus vulgaris, sjogren's disease, thyroid disease, Hashimoto's thyroiditis, myasthenia gravis, etc. The peptides modulate T-cell mediated attack on autologous target cells, and may also reduce inflammation, swelling, and release of cytokines, perforins, granzymes etc. associated with T cell activation. Sequence 10 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Clayberger C, Krensky AM;
WPI; 98-018220/02.
Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       claim 10; Page 36; 41pp; English.
The present tequence is an immunomodulatory peptide, which
comprises a class I HiA-B alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a
transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 W33787;
19-JUV198 (first entry)
Peptide B2702.75-84D77 tested for immunomodulating activity.
Immunomodulating dimer; immunosuppressant drug; CTL activation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           15-MAR-1994 (first entry)
Peptide fragment of Class I HLA peptide.
Peptide fragment of Class I HLA peptide.
Patide: transplantation; neoplasia;
parasitic disease; cytotoxic I lymphocyte; modulation.
Synthetic.
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain; rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 49; DB 1; Length 10; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 15; Page 9; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                               R83062;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                           the protein py4 from argument and sequence, epitopes, and palindromes of it (such as R95428) can be used to isolate the protein py4 from a T-cell lysate. py4 is a T-cell surface membrane to protein associated with T-cell activation in mammalian T-cells, and is a solation associated with T-cell activation in mammalian T-cells, and is a solation associated with T-cell activation in mammalian T-cells, and is a solated by inmunologically cross reactive with the heat shock protein HsC70. py4 is found in a limited number of cell types, but is particularly expressed on B and T cells. py4 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Column containing a covalently bound HLA-B2702 palindromic peptide. Column containing a covalently bound HLA-B2702 palindromic peptide. Column containing a covalently bound HLA-B2702 palindromic peptide. Combined with HLA-B2702.60-84 (see R95416), indices calcium influx, and inhibits composition and by pytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of py4 and determining T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of py4, in an amount sufficient to compete with py4 for the binding of the py4 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T-cell modulating peptide #1.

T-cell modulator: autoimmune disease; tissue destruction; alphal-domain; mandulator: autoimmune disease; tissue destruction; antigen; perforin; insulin-dependent histocompatability complex; MHC class I; antigen; perforin; insulin-dependent diabetes mellitus; multiple sclerosis; inflammation; insulin-dependent diabetes mellitus; multiple sclerosis; inflammation; theumatoid arthritis; psoriasis; pemphigus vulgaris; sjoyerer's disease; thyroid disease; Hashimoto's thyroiditis; myasthenia gravis; granzyme; autologous target cell; cytokine release; T cell activation; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treatment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of clinical symptoms of insulin dependent diabetes by modulating T cell mediated attack on target cells

Claim 7; Page 20; 24pp; English.

Claim 7; Page 20; 24pp; English.

Claim 7; Page 20; 24pp; English.

These sequences are based on a portion of the method of the invention. These sequences are based on a portion of the generic peptide corresponding to residues 70-91 of the alphal-domain of the major histocompatability complex (MHC) class I antigen (see W07510). The method is for affecting the course of an autoimmune disease involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are multiple sclerosis, rheumatoid arthritis, psoriasis, pemphigus augaris, sjooren's disease, thyroid disease, Hashimoto's thyroiditis, myasthenia gravis, etc. The peptides modulate T-cell mediated attack on autologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                   Compsns. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS. Example: Page 11: 29pp: English. This sequence represents the alphal-helix of the

The present sequence is an immunomodulatory peptide, which comprises a Class I HiA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in
                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ::

Example 1: Page 19; 41pp; English.

Example 1: Page 19; 41pp; English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating activity, including the N-terminal acylated and/or crivity.

Immunomodulating activity, including the N-terminal acylated and/or creminal amidated or esterified forms of up to 60 amino acids, where cremonand comprises the formula; A-B, where A, B = (C-terminal amidated comproses the formula; A-B, where A, B = (C-terminal amino acids; aa80 - I or N, aa81, aa84 - a hydrophobic or small amino acid; aa82 - R or L; aa83 - G or R; and as represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of Interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, chematoid atthritis and lupus erythematosis. The products can also be considered to the component of transplants or for treating autoimmune diseases, e.g. diabetes, considered to the component of transplants or for treating autoimmune diseases, e.g. diabetes, considered to the component of transplants or for treating autoimmune diseases, e.g. diabetes, considered to the component of transplants or for treating autoimmune diseases, e.g. diabetes, considered to the component of transplants or for treating autoimmune diseases, e.g. diabetes, considered to the component of transplants or for treating autoimmune diseases, e.g. diabetes, considered to the component of transplants or proventing transplants or proventing transplants or treating autoimmune diseases, e.g. diabetes, cons

Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                         Comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from amajor histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.

Peptides using the D-form anino acids are more effective immunomodulators than their diastereomers or enantiomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        19-JUN-1998 (first entry)
Peptide B2702.75-84 tested for immunomodulating activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 15; Page 36; 80pp; English.

Rample 15; Re3090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                         HIA-B2702 CTL modulating peptide (B2702.70-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

treating autolimume diseases

Example 1: Page 19: 41pp: English.

Peptides W33784-99 and W33778-9 were assayed for their immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterilided forms of up to 60 amino acids, where the peptide-type compound comprises the formula A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or Small amino acid; aa82 = R or L; aa83 = G or R; and an represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise at any peptide type bond within the brackets alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-laymphocytes (CTL) from undestrably attacking cells in a host or in vitro. They can also be cused in combination with antigenic peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of r calls in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, response to anti-tis and lupus erythematosis. The products can also be considered to see the underly attacking autoimmune diseases, e.g. diabetes, conserved the component of the conserved or treating autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of
class I major histocompatibility complex (MHC) antigens. This sequence
is an inverted dimer of residues 75-84 of the alpha-1 domain of the class
I MHC HLA-B2702. These sequences can be used to extend the period of
acceptance by a recipient of a transplant from an MHC unmatched donor.
The peptides are administered to a patient in conjunction with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HLA-B2702 CTL modulating peptide (B2702.84-75/75-84). Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Subthergoetic amount of an immunosuppressant. This is administrated to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly administration for current treatments). The peptides particularly of the patient.
New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extension of acceptance period of transplants from MHC unmatched donor hosts – using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
